

Android - Skills Test

1. Go to <https://www.thesportsdb.com/api.php> and explore all available endpoints.
2. Use “1” as api key (only for development purposes)
3. Develop an Android app with the following guidelines:
 - a. Create an splash view that presents your app (please don't delay more than two seconds)
 - b. On the main view list all teams from “**Spanish La Liga**” league, showing the following information from each one: Name, Stadium and Team badge
 - c. When a team is touched, I should go to a detail view where I should see:
 - i. Team name
 - ii. Team description
 - iii. Team foundation year
 - iv. Team badge and jersey
 - v. Next 5 events of the team
 - vi. If the team has webpage or social networks, I should see the links and be redirected when clicked

BONUS:

- On the main view create a filter with 2 more leagues (you choose) and refresh the list of teams depending of which league is selected

Final considerations

1. Min SDK version to use 21
2. Target SDK version 28
3. Use design pattern to modularize the code (MVP or MVVM you chose).
4. The idea of the test is to see how your code is and how you use Architecture patterns and Design patterns to solve problems.
